## PV201e: Conversions \& Formulas (Rev 2.0)

These are some of the conversions and formulas that are explained in our PV201e course and in the textbook "Photovoltaic Systems" by James P. Dunlop

## Conversions

1 Meter = 3.28 Feet
1 Horsepower = 746 Watts
Solar Constant $=1366 \mathrm{~W} / \mathrm{m}^{2}$
1 Peak Sun-Hour $=1 \mathrm{kWh} / \mathrm{m}^{2}=3.6$ MegaJoules $/ \mathrm{m}^{2}$

Temperature conversion:
${ }^{\circ} \mathrm{F}=\left(9 / 5 \times{ }^{\circ} \mathrm{C}\right)+32$
${ }^{\circ} \mathrm{C}=\left({ }^{\circ} \mathrm{F}-32\right) \times 5 / 9$
where
${ }^{\circ} \mathrm{F}=$ temperature in Fahrenheit
${ }^{\circ} \mathrm{C}=$ temperature in Celsius

## Formulas

## Electricity Basics: voltage, current, resistance, power

## Ohm's Law:

$V=I \times R$
$I=V / R$
$R=V / I$
where
$I=$ Current, the flow of electricity (in Amperes (A))
$V$ (also written $E$ ) = Voltage, the potential or pressure to cause a flow of electricity (in Volts (V))
$R=$ Resistance, resists the flow of electricity (larger diameter wire $=$ less resistance) (in Ohms ( $\Omega$ ))

Maximum Power of Solar Module:
$P_{m p}=V_{m p} \times I_{m p}$
where
$P_{m p}=$ maximum power (in W)
$V_{m p}=$ maximum power voltage (in V )
$I_{m p}=$ maximum power current (in A)

## The Solar Resource \& Site Assessment

## Solar Irradiation:

$H=E \times t$
where
$H$ = solar irradiation (in Wh/m ${ }^{2}$ )
$E=$ average solar irradiance (in $\mathrm{W} / \mathrm{m}^{2}$ )
$T=$ time (in hr)
Solar Irradiance Response: The relationships between irradiance, current, and power can be expressed by the following ratios:
$E_{2} / E_{1}=I_{2} / I_{1}=P_{2} / P_{1}$
where
$E_{2}=$ solar irradiance $2\left(\right.$ in $\left.\mathrm{W} / \mathrm{m}^{2}\right)$
$E_{1}=$ solar irradiance 1 (in W/m²)
$I_{2}=$ current at irradiance 2 (in A)
$I_{1}=$ current at irradiance 1 (in A)
$P_{2}=$ power at irradiance 2 (in W)
$P_{1}=$ power at irradiance 1 (in W)
This relationship can be used to estimate how changes in irradiance affect shortcircuit current, maximum power current, or maximum power changes:
$I_{s c 2}=I_{s c 1} \times\left(E_{2} / E_{1}\right)$
$I_{m p 2}=I_{m p 1} \times\left(E_{2} / E_{1}\right)$
$P_{m p 2}=P_{m p 1} \times\left(E_{2} / E_{1}\right)$

## Array Area Estimate:

$A=P_{m p} /\left(1 \mathrm{~kW} / \mathrm{m}^{2}{ }_{x} \eta_{m}\right)$
where
$A=$ estimated required array area (in $\mathrm{m}^{2}$ )
$P_{m p}=$ desired peak array power (in kW DC)
$\eta_{m}=$ module efficiency

## Roof Slope to Tilt Angle

Example: 4:12 rise to run roof slope
Arctan of 4/12 = 18.4 degrees
Arctan is also shown on some calculators as tan -1

Trigonometry
$\operatorname{Sin} \beta^{\circ}=$ side opposite/hypotenuse (beta)
$\operatorname{Cos} \psi^{\circ}=$ adjacent side/hypotenuse (sigh)
Tan $\alpha^{\circ}=$ side opposite/side adjacent (alpha)
In terms of shade analysis:
d_shadow $=$ height $/ \tan \alpha^{\circ}$
Tan $\alpha^{\circ}=$ height/d_shadow
Height $=\tan \alpha \%$ d_shadow
Where height = the top of the modules in one row to the bottom of the modules in the next row to the north;

Where the angle $\alpha^{\circ}$ (theta) is the sun's elevation angle also called the sun's altitude angle

## Formula to account for the azimuth correction angle:

d_min $=$ d_shadow $x \cos \psi^{\circ}$
Where the angle $\psi^{\circ}$ (sigh) is the azimuth correction angle calculated from due south which is 180 degrees or is zero degrees depending on the type of sun path diagram;

## Solar Cells, Modules, and Arrays

## Efficiency of Solar Module:

$\eta=P_{m p} /(E \times A)$
where
$\eta=$ efficiency
$P_{m p}=$ maximum power (in W)
$E=$ solar irradiance (in W/m²)
$A=\operatorname{area}\left(\right.$ in $\left.\mathrm{m}^{2}\right)$

## Resistance Required at Maximum Power Point:

$R_{m p}=V_{m p} / I_{m p}$
where
$R_{m p}=$ resistance at maximum power point (in $\Omega$ )
$V_{m p}=$ maximum power voltage (in V )
$I_{m p}=$ maximum power current (in A)

## Cell Temperature Estimate:

$T_{\text {cell }}=T_{\text {amb }}+\left(C_{T-r i s e} \times E\right)$
where
$T_{\text {cell }}=$ cell temperature (in ${ }^{\circ} \mathrm{C}$ )
$T_{\text {amb }}=$ ambient temperature (in ${ }^{\circ} \mathrm{C}$ )
$C_{\text {T-rise }}=$ temperature-rise coefficient (in ${ }^{\circ} \mathrm{C} / \mathrm{kW} / \mathrm{m}^{2}$ )
$E=$ solar irradiance (in $\mathrm{kW} / \mathrm{m}^{2}$ )

## Module or Array Coefficients:

For Voltage:
$C_{V}=C_{V-\text { cell }} \times n_{s}$
where
$C_{V}=$ module or array absolute temperature coefficient for voltage (in $\mathrm{V} /{ }^{\circ} \mathrm{C}$ )
$C_{V-c e l l}=$ cell absolute temperature coefficient for voltage (in V/ ${ }^{\circ} \mathrm{C} /$ cell)
$n_{s}=$ number of series-connected cells

For Current: $C_{l}=C_{l-\text { cell }} \times n_{P} \times A$
where
$C_{l}=$ module or array absolute temperature coefficient for current (in $\mathrm{A} /{ }^{\circ} \mathrm{C}$ )
$C_{\text {l-cell }}=$ cell absolute temperature coefficient for current (in $\mathrm{A} /{ }^{\circ} \mathrm{C} / \mathrm{cm}^{2}$ )
$n_{P}=$ number of parallel-connected cell strings
$A=$ individual cell area (in $\mathrm{cm}^{2}$ )

## Temperature Coefficients:

$C_{V}=V_{\text {ref }} \times C_{\%}$
$C_{l}=I_{\text {ref }} \times C_{\%}$
$C_{P}=P_{\text {ref }} \times C_{\%}$
where
$C_{V}=$ absolute temperature coefficient for voltage (in $\mathrm{V} /{ }^{\circ} \mathrm{C}$ )
$V_{\text {ref }}=$ reference (or rated) voltage (in V )
$C_{\% V}=$ relative temperature coefficient for voltage (in $\mathrm{V} /{ }^{\circ} \mathrm{C}$ )
$\mathrm{C}_{l}=$ absolute temperature coefficient for current (in $\mathrm{A} /{ }^{\circ} \mathrm{C}$ )
$I_{\text {ref }}=$ reference (or rated) current (in A)
$\mathrm{C}_{\%}=$ relative temperature coefficient for current (in $/{ }^{\circ} \mathrm{C}$ )
$C_{P}=$ absolute temperature coefficient for power (in W/ ${ }^{\circ} \mathrm{C}$ )
$P_{\text {ref }}=$ reference (or rated) power (in W)
$\mathrm{C}_{\% \mathrm{P}}=$ relative temperature coefficient for power (in $/{ }^{\circ} \mathrm{C}$ )

## Voltage and Power Translations:

$V_{\text {trans }}=V_{\text {ref }}+\left(\left[T_{\text {cell }}-T_{\text {ref }}\right] \times C_{V}\right)$
$P_{\text {trans }}=P_{\text {ref }}+\left(\left[T_{\text {cell }}-T_{\text {ref }}\right] \times C_{P}\right)$
Where,
$V_{\text {trans }}=$ translated voltage at cell temperature (in V )
$V_{\text {ref }}=$ reference (or rated) voltage corresponding to $T_{\text {ref }}$ (in V )
$T_{\text {cell }}=$ cell temperature (in ${ }^{\circ} \mathrm{C}$ )
$T_{\text {ref }}=$ reference (or rated) temperature (in ${ }^{\circ} \mathrm{C}$ )
$C_{V}=$ absolute temperature coefficient of voltage (in $\mathrm{V} /{ }^{\circ} \mathrm{C}$ )
$P_{\text {trans }}=$ translated power at cell temperature (in W)
$P_{\text {ref }}=$ reference (or rated) power corresponding to $T_{\text {ref }}$ (in W)
$C_{P}=$ absolute temperature coefficient of power (in W/ ${ }^{\circ} \mathrm{C}$ )

## Performance Analysis

Annual PV System Performance (approximate) in annual kWhs:
(average peak sun hours) $\times$ (system de-rating factor) $\times$ (array total Watts dc-STC) x 365 x Acorr
where

Acorr = azimuth correction from due south
Therefore, Acorr = 1.0 if azimuth of PV array is due south

## Charge Controllers

> Voltage Regulation Hysteresis:
> VRH = VR - ARV
> where
> VR = Voltage Regulation Setpoint (in V)
> ARV = Array Reconnect Voltage Setpoint (in V)

## Low-Voltage Disconnect Hysteresis:

LVDH = LVD - LRV
where
LVD = Low-Voltage Disconnect Setpoint (in V)
LRV = Load Reconnect Voltage Setpoint (in V)

## Setpoint Voltage at Battery Temperatures other than $25^{\circ} \mathrm{C}$ :

$\mathrm{V}_{\text {comp }}=\mathrm{V}_{\text {set }}-\left(\mathrm{C}_{\mathrm{Vcell}} \times\left[25-\mathrm{T}_{\text {bat }}\right] \times \mathrm{n}_{\mathrm{s}}\right)$
where
$\mathrm{V}_{\text {comp }}=$ temperature-compensated setpoint voltage (in V )
$\mathrm{V}_{\text {set }}=$ nominal setpoint voltage at $25^{\circ} \mathrm{C}$ (in V )
$\mathrm{C}_{\text {vcell }}=$ temperature compensation coefficient (in $\mathrm{V} /{ }^{\circ} \mathrm{C} /$ cell)
$\mathrm{T}_{\text {bat }}=$ battery temperature (in ${ }^{\circ} \mathrm{C}$ )
$\mathrm{n}_{\mathrm{s}}=$ number of battery cells in series

## Inverters

Energy
$E=P_{\text {avg }} \times t$
where
$E=$ energy (Wh)
$P_{\text {avg }}=$ average power (W)
$t=$ time (hrs)

## Ohm's Law

$V=I \times R$
$I=\frac{V}{R}$
$R=\frac{V}{I}$
where
$V=$ voltage ( V )
$I=$ current (A)
$R=$ resistance $(\Omega)$

## Power in DC Circuits

$P=V \times I$
$P=I^{2} \times R$
$P=\frac{V^{2}}{R}$
where
$P=$ power (W)
$V=$ voltage (V)
$I=$ current (A)
$R=$ resistance $(\Omega)$

## Real Power in AC Circuits

$P=V \times I \times \cos \theta$
$P=V \times I \times P F$
where
$P=$ power (W)
$V=$ voltage ( V )
$I=$ current (A)
$\theta=$ phase angle (deg)
$\cos \theta=$ power factor $(0-1)$
In 3-phase circuits:
$P=V \times I \times \cos \theta \times \sqrt{3}$

## Inverter Efficiency

$\eta_{i v v}=\frac{P_{A C}}{P_{D C}}=\frac{5700}{6000}=0.95=95 \%$
where
$\eta_{i v v}=$ inverter efficiency
$P_{A C}=$ AC power ouput (W)
$P_{D C}=$ DC power input (W)

## Transformer Turns Ratio

$\frac{N_{1}}{N_{2}}=\frac{V_{1}}{V_{2}}=\frac{I_{2}}{I_{1}}$
where
$N_{1}$ and $N_{2}=$ number of turns in primary and secondary windings $V_{1}$ and $V_{2}=$ voltage in primary and secondary windings $I_{1}$ and $I_{2}=$ voltage in primary and secondary windings

## System Sizing

## Weighted Average Operating Time:

$t_{\text {op }}=\left[\left(E_{1} \times t_{1}\right)+\left(E_{2} \times t_{2}\right)+\ldots+\left(E_{n} \times t_{n}\right)\right] /\left(E_{1}+E_{2}+\ldots+E_{n}\right)$
where
$\mathrm{t}_{\mathrm{op}}=$ weighted average operating time (in hr/day)
$\mathrm{E}_{1}=\mathrm{DL}$ energy required for load 1 (in Wh/day)
$\mathrm{t}_{1}=$ operating time for load 1 (in hr/day)
$\mathrm{E}_{2}=\mathrm{DL}$ energy required for load 2 (in Wh/day)
$\mathrm{t}_{2}=$ operating time for load 2 (in hr/day)
$\mathrm{E}_{\mathrm{n}}=\mathrm{DL}$ energy required for nth load (in Wh/day)
$t_{1}=$ operating time for nth load (in hr/day)

## Required Daily System DC Electrical Energy

$E_{S D C}=\left(E_{A C} / \eta_{\text {inv }}\right)+E_{D C}$
where
$\mathrm{E}_{\text {SDC }}=$ required daily system DC electrical energy (in Wh/day)
$\mathrm{E}_{\mathrm{AC}}=\mathrm{AC}$ energy consumed by loads (in Whr/day)
$\eta_{\text {inv }}=$ inverter efficiency
$E_{D C}=D C$ energy consumed by loads (in Whr/day)

## Required Battery-Bank Output

$B_{\text {out }}=\left(E_{\text {crit }} \times t_{a}\right) / V_{S D C}$
where
$B_{\text {out }}=$ required battery-bank output (in Ah)
$\mathrm{E}_{\text {crit }}=$ average daily electrical-energy consumption during critical design month (in Wh/day)
$\mathrm{t}_{\mathrm{a}}=$ autonomy (in days)
$\mathrm{V}_{\text {SDC }}=$ nominal DC-system voltage (in V )

## Average Discharge Rate

$R_{d}=\left(t_{\text {op }} \times t_{a}\right) / D O D_{a}$
where
$\mathrm{R}_{\mathrm{d}}=$ average discharge rate (in hr)
$\mathrm{t}_{\mathrm{op}}=$ weighted average operating time (in hr/day)
$\mathrm{t}_{\mathrm{a}}=$ autonomy (in days)
$D O D_{a}=$ allowable depth of discharge

## Total Required Battery-Bank Rated Capacity

$B_{\text {rated }}=B_{\text {out }} /\left(D O D_{a} \times C_{T, r d}\right)$
where
$B_{\text {rated }}=$ battery-bank rated capacity (in Ah)
$B_{\text {out }}=$ battery-bank required output (in Ah)
$D O D_{a}=$ allowable depth of discharge
$C_{T, r d}=$ temperature and discharge-rate derating factor

## Average Battery-Bank Daily Depth of Discharge

$D O D_{\text {avg }}=\left(L F \times E_{\text {day }}\right) /\left(B_{\text {actual }} \times V_{S D C}\right)$
Where
$D O D_{\text {avg }}=$ average battery-bank daily depth of discharge
LF = estimated load fraction
$E_{\text {day }}=$ average daily electrical-energy consumption (in Wh)
$B_{\text {actual }}=$ actual total rated battery-bank capacity (in Ah)
$V_{S D C}=$ DC-system voltage (in V)

## Required Array Maximum-Power Current

$l_{\text {array }}=E_{\text {crit }} /\left(\eta_{\text {batt }} \times V_{S D C} \times t_{P S H}\right)$
where
$I_{\text {array }}=$ required array maximum-power current (in A)
$E_{\text {crit }}=$ daily electrical-energy consumption during critical design month (in Wh/day)
$\eta_{\text {batt }}=$ battery-system charging efficiency
$V_{S D C}=$ nominal DC-system voltage (in V)
$t_{\text {PSH }}=$ peak sun hours for critical design month (in hr/day)

## Rated Array Maximum-Power Current

$I_{\text {rated }}=I_{\text {array }} / C_{s}$
where
$I_{\text {rated }}=$ rated array maximum-power current (in A)
$I_{\text {array }}=$ required array maximum-power current (in A)
$C_{s}=$ soiling derating factor

$$
\begin{aligned}
& \text { Rated Array Maximum-Power Voltage } \\
& V_{\text {rated }}=1.2 \times\left\{V_{S D C}-\left[V_{S D C} \times C_{\% V} \times\left(T_{\max }-T_{\text {ref }}\right)\right]\right\} \\
& \text { Where } \\
& \left.V_{\text {rated }}=\text { rated array maximum-power voltage (in } \mathrm{V}\right) \\
& \left.V_{S D C}=\text { nominal DC-system voltage (in } \mathrm{V}\right) \\
& \left.C_{\% V}=\text { temperature coefficient for voltage month (in } /{ }^{\circ} \mathrm{C}\right) \\
& T_{\text {max }}=\text { maximum expected module temperature }\left(\text { in }{ }^{\circ} \mathrm{C}\right) \\
& \left.T_{\text {ref }}=\text { reference or rating temperature (in }{ }^{\circ} \mathrm{C}\right)
\end{aligned}
$$

## INTERACTIVE PV SYSTEM PERFORMANCE WORKSHEET

Estimating and Verifying System AC Energy Production
PV Array DC Power Rating at STC - $1000 \mathrm{~W} / \mathrm{m}^{2}, 25^{\circ} \mathrm{C}$ (kW) ..... 10
Derating Factors
Nameplate Ratings ..... 0.95
Inverter and Transformer ..... 0.95
Module Mismatch ..... 0.98
DC Wiring ..... 0.98
AC Wiring ..... 0.99
Soiling ..... 1.00
Shading ..... 0.85
Sun Tracking ..... 1.00
Age ..... 1.00
Combined Derating Factors ..... 0.73
Estimated System AC Power Output at STC - $1000 \mathrm{~W} / \mathrm{m}^{2}, 25^{\circ} \mathrm{C}(\mathrm{kW})$ ..... 7.3
Temperature Adjustments
Array Power-Temperature Coefficient $\left(\% /^{\circ} \mathrm{C}\right)$ ..... -0.5
Average Array Operating Temperature ( ${ }^{\circ} \mathrm{C}$ ) ..... 45
Estimated System AC Power Output at $1000 \mathrm{~W} / \mathrm{m}^{2}$ and Average Operating Temperature (kW) ..... 6.6
Solar Radiation Received
Solar Irradiation in Plane of Array ( $\mathrm{kWh} / \mathrm{m}^{2} /$ day ) ..... 5
Estimated System AC Energy Output at Average Operating Temperature (kWh/day) ..... 29.5

## Electrical Integration

## Maximum PV System Voltage

$$
V_{\max }=V_{o c} \times n_{m} \times C_{T}
$$

where
$V_{\max }=$ maximum system voltage (V)
$V_{o c}=$ module rated open-circuit voltage at $25^{\circ} \mathrm{C}(\mathrm{V})$
$n_{m}=$ number of series-connected modules
$C_{T}=$ low-temperature correction factor

## Maximum Inverter Input Current

For stand-alone inverters operating from batteries, the maximum inverter input current must be evaluated at the lowest operating voltage when the inverter is producing rated power. $\mathrm{P}_{\mathrm{AC}}$ is the rated inverter maximum continuous $A C$ power output (in W).
$I_{m a x}=\frac{P_{A C}}{V_{\min } \times \eta_{i n v}}$
where
$I_{\text {max }}=$ maximum inverter input current (A)
$P_{A C}=$ rated inverter maximum AC power output (W)
$V_{\text {min }}=$ minimum inverter operating voltage (V)
$\eta_{i n v}=$ inverter efficiency

## Conductor Nominal Ampacity

$I_{\text {nom }}=I_{\text {max }} /\left(\right.$ CF $\left._{\text {temp }} \times C F_{\text {conduit }}\right)$
where
$I_{\text {nom }}=$ conductor nominal ampacity (in A)
$I_{\max }=$ maximum circuit current (in A)
$\mathrm{CF}_{\text {temp }}=$ correction factor for temperature
$\mathrm{CF}_{\text {conduit }}=$ correction factor for number of current-carrying conductors in a conduit or cable

## Voltage Drop

$V_{\text {drop }}=I_{o p} \times R_{C} \times L$
where
$V_{\text {crop }}=$ voltage drop (V)
$I_{o p}=$ operating current (A)
$R_{C}=$ conductor resistance per unit length $(\Omega / \mathrm{kft}$ )
$L=$ total conductor round-trip length (kft)

## Economic Analysis

Time Value of Money

$$
P V=\frac{F V}{(1+r)^{t}}
$$

Where:
PV = present value
FV = future value
$r=$ discount rate
$t=$ time period

## Life-Cycle Cost Analysis

$L C C=I+M_{P V}+E_{P V}+R_{P V}-S_{P V}$
where
$\mathrm{L}_{\mathrm{CC}}=$ life-cycle cost (\$)
$I=$ initial cost (\$)
$\mathrm{M}_{\mathrm{PV}}=$ present value of maintenance costs (\$)
$E_{P V}=$ present value of energy costs (\$)
$\mathrm{R}_{\mathrm{PV}}=$ present value of repair and replacements (\$)
$\mathrm{S}_{\mathrm{PV}}=$ present value of salvage value (\$)
